Review of Educational Research, 63, Clark, C. Loss of genomic stability, characterized by a high rate of damage to DNA and chromosomesis a hallmark of cancer The current understanding is that the pool of NAD is decreased during niacin deficiency and that it affects the activity of NAD-consuming enzymes rather than redox and metabolic functions Cellular depletion of NAD has been found to decrease levels of the tumor suppressor protein p53, a target for poly ADP-ribosylation, in human breast, skin, and lung cells The expression of p53 was also altered by niacin deficiency in rat bone marrow cells Impairment of DNA repair caused by niacin deficiency could lead to genomic instability and drive tumor development in rat models 47, Both PARPs and sirtuins have been recently involved in the maintenance of heterochromatin, a chromosomal domain associated with genome stability, as well as in transcriptional gene silencing, telomere integrity, and chromosome segregation during cell division 49, Neither the cellular NAD content nor the dietary intake of NAD precursors necessary for optimizing protective responses following DNA damage has been determined, but both are likely to be higher than that required for the prevention of pellagra.
